

MANURE TREATMENT

Pieralisi guarantees a maximum of 0,1% in the liquid fraction

The more than 80 installed Pieralisi decanter centrifuges separate more than 3.2 million tons of manure a year. Pieralisi decanter centrifuges play a very important role in the processing of manure. The phosphate in the manure is reduced to 0.07 to 0.1% or 0.7 to 1 kg/m³ manure, while solid fraction leaves the centrifuge with a dry matter content of 32-35%.
